Abstract

In Alaska, mass marking of salmon using otolith thermal marking is proving to be an effective research and management tool in a variety of situations. However rearing constraints in the hatcheries as well as limitations on the ability to heat or chill water, creates difficulties in assigning unique marks to each release group. Furthermore these conditions may change each year making it difficult to ensure that the assigned mark will actually be produced and that a hatchery will follow their planned release strategies. Nonetheless for the purpose of avoiding conflicting marks it is important to document as well as possible the patterns that are intended to be applied. This report provides this data for Alaska thermal mark releases.

Proposed marks

Table 1 contains a list of proposed marks that are likely to be applied to brood year 2001 release groups. This year it is anticipated that 66 marking groups will be released by 16 facilities. Most of these are well established programs and in those cases the mark will be similar to those applied to brood year 2000 salmon and the release numbers will be similar. New marking programs on coho and chinook salmon will be started at Elmendorf and Fort Rich hatcheries in the Southcentral region. The purpose of these programs will be to monitor hatchery contributions to recreational fisheries in Cook Inlet and Resurrection Bay near Seward.

Table 1. Summary of thermal mark codes that may be applied to Alaska hatchery salmon in brood year 2001.

NO	TYPE	BROOD YEAR	YEAR OF RELEASE	SPECIES	REGION	AGENCY	FACILITY	STOCK	FINAL RELEASE SITE	STAGE	RBI CODE	HATCH CODE	PREHATCH GRAPHIC IMAGE	POSTHATCH GRAPHIC IMAGE	PRELIMINARY NUMBER OF OM RELEASED	COMMENTS
